Power electronics is the application of solid-
state electronics to the control and conversion of electric power. The first high power electronic devices were mercury-arc valves. In modern systems, the conversion is performed with semiconductor switching devices such as diodes, thyristors, and power transistors such as the power MOSFET and IGBT. In contrast to electronic
systems concerned with ...

Figure 1 PAM4 doubles the number of bits in serial data transmissions by increasing the number of levels of pulse-amplitude modulation, but does so at the cost of noise susceptibility. If we look at that NRZ signal as an eye diagram, it will have a bit period, $T$, and
amplitude, A. The required bandwidth for this signal is related to the bit period (1/T).
